Canadian Data Report of Fisheries and Aquatic Sciences No. 384

Canadian Data Report of Fisheries and Aquatic Sciences

These reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of Data Reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries management, technology and development, ocean sciences, and aquatic environments relevant to Canada.

Numbers 1-25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26-160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was changed with report number 161.

Data Reports are not intended for general distribution and the contents must not be referred to in other publications without prior written clearance from the issuing establishment. The correct citation appears above the abstract of each report.

Rapport statistique canadien des sciences halieutiques et aquatiques

Ces rapports servent de base à la compilation des données de classement et d'archives pour lesquelles il y a peu ou point d'analyse. Cette compilation aura d'ordinaire été préparée pour appuyer d'autres publications ou rapports. Les sujets des Rapports statistiques reflètent la vaste gamme des intérêts et politiques du Ministère des Pêches et des Océans, notamment gestion des pêches, techniques et développement, sciences océaniques et environnements aquatiques, au Canada

Les numéros 1 à 25 de cette série ont été publiés à titre de Records statistiques, Service des pêches et de la mer. Les numéros 26-160 ont été publiés à titre de Rapports statistiques du Service des pêches et de la mer, Ministère des Pêches et de l'Environnement. Le nom de la série a été modifié à partir du numéro 161.

Les Rapports statistiques ne sont pas préparés pour une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au haut du résumé de chaque rapport.

ABSTRACT

Irwin, B., P. Lindley, C.L. Gallegos and T. Platt. 1983. Phytoplankton productivity experiments on the Scotian Shelf from April 18 to May 2, 1979. Can. Data Rept. Fish. Aquat. Sci. No. 384: 118 p.

Series of primary productivity experiments and related nutrient determinations were made on CSS Hudson during a cruise on the Scotian Shelf from April 18 to May 2, 1979. In this report we make available the raw data and also the fitted light saturation parameters with confidence limits.

RÉSUMÉ

Irwin, B., P. Lindley, C.L. Gallegos and T. Platt. 1983. Phytoplankton productivity experiments on the Scotian Shelf from April 18 to May 2, 1979. Can. Data Rept. Fish. Aquat. Sci. No. 384: 118 p.

On a, au cours d'une campagne du CSS Hudson sur le plateau continental de Scotian, menée du 18 avril au 2 mai 1979, réalisé une série d'expériences et mesuré des éléments nutritifs relatifs à la productivité primaire. Le rapport contient les données de base, la valeur des paramètres ajusté décrivant la saturation en lumière et les limites de confiance.

INTRODUCTION

This is the fourth in a series of data reports presenting the results of photosynthesis experiments on natural phytoplankton populations of the Scotian Shelf and adjacent oceanic waters. Samples were collected from CSS Hudson between April 18th and May 2nd, 1979 at a total of fourty-four stations. The eastern and western boundaries of the sampling area were 61°19'W and 62°48.6'W respectively and the northern and southern boundaries were 44°30.2'N and 39°54'N respectively.

Two diurnal experiments were conducted at fixed locations from April 26 to 27 (Stations D1-7) and from May 1st to 2nd (Stations F1-9). The remainder of the experiments were carried out at stations located across the shelf break (Figure 1).

This was a joint cruise between the Marine Ecology Laboratory and the Metrology Division of the Atlantic Oceanographic Laboratory.

In this report we present the experimental results, the light saturation parameters along with their confidence intervals and the corresponding measurements of various environmental parameters.

SAMPLING

Water samples were collected at various depths with thirty litre Niskin bottles and with a bucket from the surface. Samples for light saturation experiments were taken as follows:

Stations No. 1, 3-13, E15 - 1% and 50% light levels as determined from a secchi disc.

Diurnal Stations (D1-7, F1-9) - 35 m.

Stations E1-14 - One depth (20, 25 or 35 m).

In addition, water was sampled at some stations to 100 m using the rosette for a more detailed examination of the chemical and physical structure of the upper water column.

METHODS

Primary productivity was measured using the method of Strickland and Parsons (1972). For each light saturation experiment 8 litres of water were innoculated with sodium bicarbonate ^{14}C solution to yield an approximate activity of 10 µci per 100 ml. This was dispensed in 100 ml aliquots into thirty pairs of light and two pairs of dark 125 ml pyrex glass bottles. The bottles were then placed in temperature controlled incubators illuminated by 2000 watt tungsten-halogen lamps (New Haline OH2 2000) having a maximum light intensity of approximately 1000 W m^{-2} (PAR). The incubation time was variable (2, 3 or 4 hours) dependent on the sampling and experiment schedule.

At the end of the incubation period the samples were filtered onto 2.5 cm diameter 0.45 µm pore size membrane filters, and stored in a dessicator at -20°C. Filters were later thawed, exposed to HCl fumes and counted in a Scintillation counter.

Chlorophyll a

Duplicate 1 litre samples were filtered onto 5.5 cm glass fibre filters and stored in a dessicator at -20°C. These were later thawed and analysed using the fluorometric technique of Yentsch and Menzel (1963) as modified by Holm-Hansen *et al.* (1965). A model III Turner Fluorometer was used having been calibrated with acetone extracts of pure chlorophyll *a* (Sigma Chemical Co.).

Incubator Light Intensity

The photosynthetically active radiation (PAR) was measured for each position occupied by a light bottle in the incubator using a Licor Li 185A Quantum meter with a 190S underwater quantum sensor.

Nutrients

Four inorganic nutrients were measured from each sample. Three of these, phosphate, silicate and nitrate were measured on a Technicon II autoanalyzer. The following methods were used:

Phosphate - industrial method 155-71W

Nitrate - industrial method 158-71W

Silicate - industrial method 186-72W

Ammonia was measured using the phenolhypochlorite method of Solorzano (1969).

Nucleic Acids

Replicate 1 litre samples were filtered onto 5.5 cm glass fibre filters (GF/C) and stored at -20°C in a dessicator. The frozen filters were homogenized in buffered sodium chloride solution at 0°C then centrifuged. The clear supernatant was transferred to a test tube and an equal volume of the dye Ethidium Bromide was added with vigorous mixing. The fluorescence of this mixture was measured on a Model III Turner fluorometer (Excitation filter Corning 7-60, Emission filter Wratten 23A). This yielded a measure of Ribonucleic acid (RNA) plus Deoxibonucleic acid (DNA) RNAse solution, 0.04 ml, was added to the test tube, mixed and incubated at 50°C for 60 minutes. The fluorescence was remeasured. This second reading

was a measure of DNA concentration only. RNA concentration was determined by difference.

Adendosine Triphosphate (ATP)

Duplicate 100 ml samples were filtered onto 2.4 cm baked glass fibre filters (Whatman GF/C) and immediately placed into 10 ml test tubes containing 5 ml of boiling tris buffer. After 3 minutes the tubes were cooled to room temperature then stored at -20°C. ATP concentrations were estimated using the technique described in Strickland and Parsons (1972) using an SAI Model 200 Integrating photometer.

Particulate Carbon

Duplicate 500 ml samples were filtered onto previously baked 2.4 cm glass fibre filters and sucked dry. Filters were then folded, placed in baked aluminum foil wrappers and stored at -20°C. Filters were freeze-dried overnight before combustion in a Hewlett-Packard Model 185B CHN analyzer.

Protein

Particulate protein was measured using the modified Packard and Dortch (1975) fluorescamine method described in Irwin et al. (1982).

Cell Numbers

For each sample 500 ml were preserved with lugols solution for species identification and enumeration. Estimates of particle concentration for each sample were done using a Model TA II Coulter Counter.

Light Saturation Parameters

The three parameter model for photosynthesis predicts a unique optimal intensity for photosynthesis, unless $\beta = 0$, in which case there is no photoinhibition over the range of observed light intensities. On this cruise we observed many cases in which photosynthesis was light saturated over a relatively wide range of intensities, out to an apparent threshold, beyond which photoinhibition was pronounced. An additional parameter is required to describe data with that property. For experiments with a threshold for photoinhibition we use the equation:

$$P^B = \left(\frac{P_s}{2}\right) \tanh\left(I/I_s\right) \left(1 - \frac{I - I'_b}{\left[(I-I'_b)^6 + I'^6_T\right]^{1/6}}\right)$$

The parameter P_s is the light saturated photosynthetic rate and the parameter I_s is related to α by the identity $I_s = P_s/\alpha$. The parameter I'_b is the itensity (such that $I > I_s$) at which $P^B = P_s/2$. The threshold of photoinhibition is the derived parameter $I_T = I'_b - I'_T$ The derived parameter $I_{bU} = I'_b + I'_T$ is the intensity at which extrapolation of the maximum negative slope of the photoinhibited portion of the curve intersects zero production rate. The analagous parameter for the three parameter equation is given by the identity $I_b = P_s/\beta$. I_b is the parameter to use when comparing experiments fitted by different models for their susceptibility to photoinhibition.

We used the following procedure for deciding when it was necessary to use the four parameter equation. Initially the three parameter equation was fitted to all experiments. The residuals of the fit for intensities greater than 80 Wm^{-2} were then examined for significant quadratic dependence with irradiance. The four parameter equation was used whenever a

second order polynomial fit to the residuals, with irradiance as the independent variable, resulted in a significant reduction in the sum of squared residuals as judged by an F test at the 0.01 significance level. Details of the procedure are given by Gallegos and Platt (1981) and Platt and Gallegos (1980).

ACKNOWLEDGEMENTS

We wish to thank Paul Dickie, Subba Rao Durvasula, Mark Hodgson and Leslie Harris for their technical assistance during the cruise. We also wish to thank Dave Rudderham for his assistance in the calculation of the light saturation parameters.
